

faoswsStandardization: Full Standardization and Balancing Data-sets content and plug-in execution

Cristina Muschitiello
Food and Agriculture Organization of the United Nations

6 June 2018

Abstract

This vignette provides a description on the execution of the “Full Standardization and Balancing” plugin: this is the plugin that, starting from the data collected and pulled into the input data-set `sua_unbalanced`, performs all the steps of the standardization and balancing (as described methodologically in a separate document) and save the data into 3 different output data-sets

The views expressed in this Working Paper are those of the author and do not necessarily represent those of the FAO or FAO policy. Working Papers describe research in progress by the authors and are published to elicit comments and to further discussion.

This paper is dynamically generated on June 6, 2018 and is subject to changes and updates.

The Data flow

The data Flow of the Standardization and Balancing Plugin is reported in 1. For detail about the methodology, please see the document *Standardization & Balancing for Food Balance Sheet Calculation*.

Figure 1: Data Flow of Standardization and Balancing

The *Standardization and Balancing* involves 5 datasets and 4 data tables in the SWS. One peculiarity of this plug-in is that it saves data in 3 different data-sets. As a consequence, for executing it, it is necessary to open 3+1 sessions (3 for the output data-sets and 1 for the input data-set).

1 Log-in in the SWS

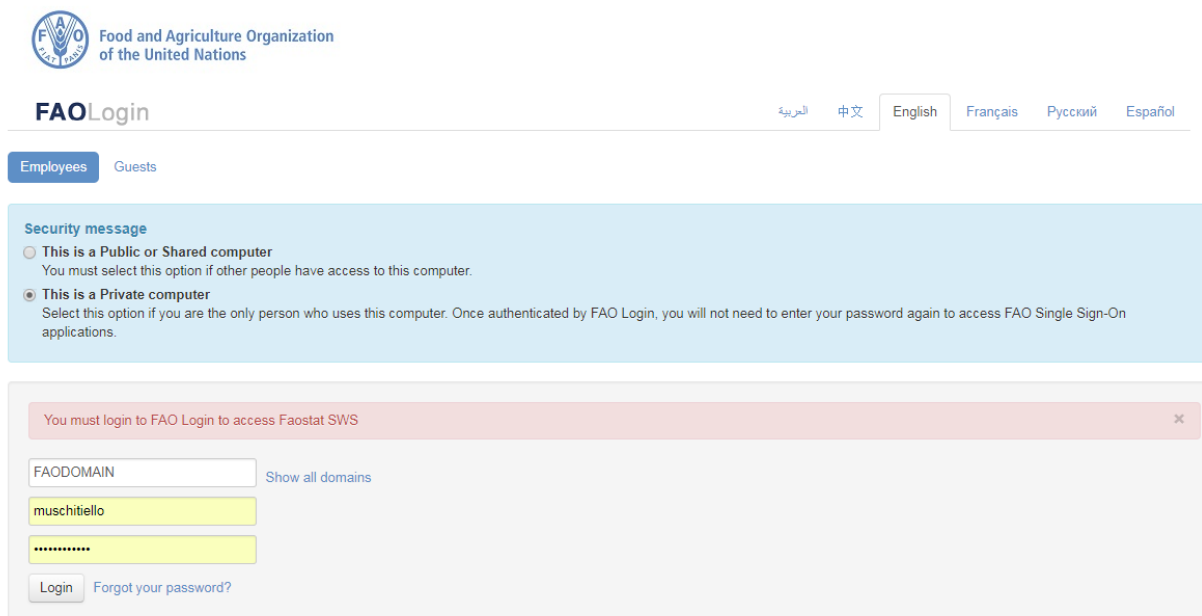

Figure 2: Log-in in the SWS

2 Data Pull

First, data from different data-sets have to be pulled inside the **sua-unbalanced** data-set and save the data back. This step is performed through a plug-in called **pullDataToSua** which is documented in a separate document. A general workflow would probably start from the pulling of all data for all countries, which are then saved in the SWS for all the users to start producing FBSs on single countries.

3 Open The Sessions.

4 sessions have to be opened, each one has to be named. This is not mandatory, but is important enough for reducing confusion and risk error when the plug-in has to be run. For this document an example on China Mainland, years from 2010 to 2016 is used.

3.1 sua-unbalanced session

This is the session on the *input* data-set. After having used the *New-session* button, this session has to be opened in the *suaafs:sua_unbalanced*. Therefore *SUA/FBS* domain and *sua_unbalanced* have to be selected from the screen (figures 3 to 5).

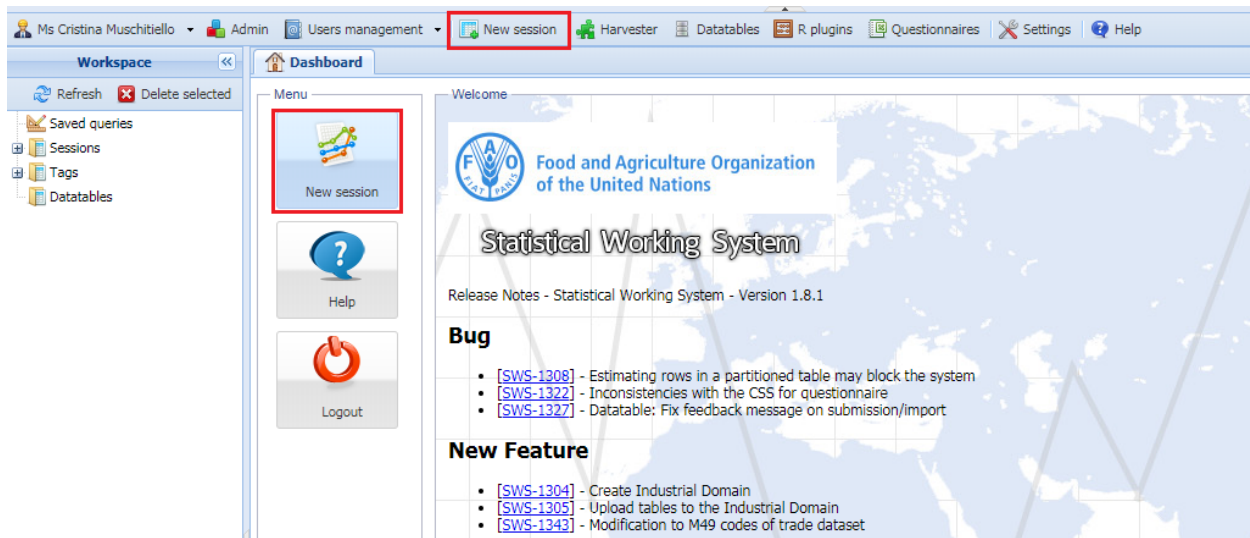

Figure 3: Open a new Session

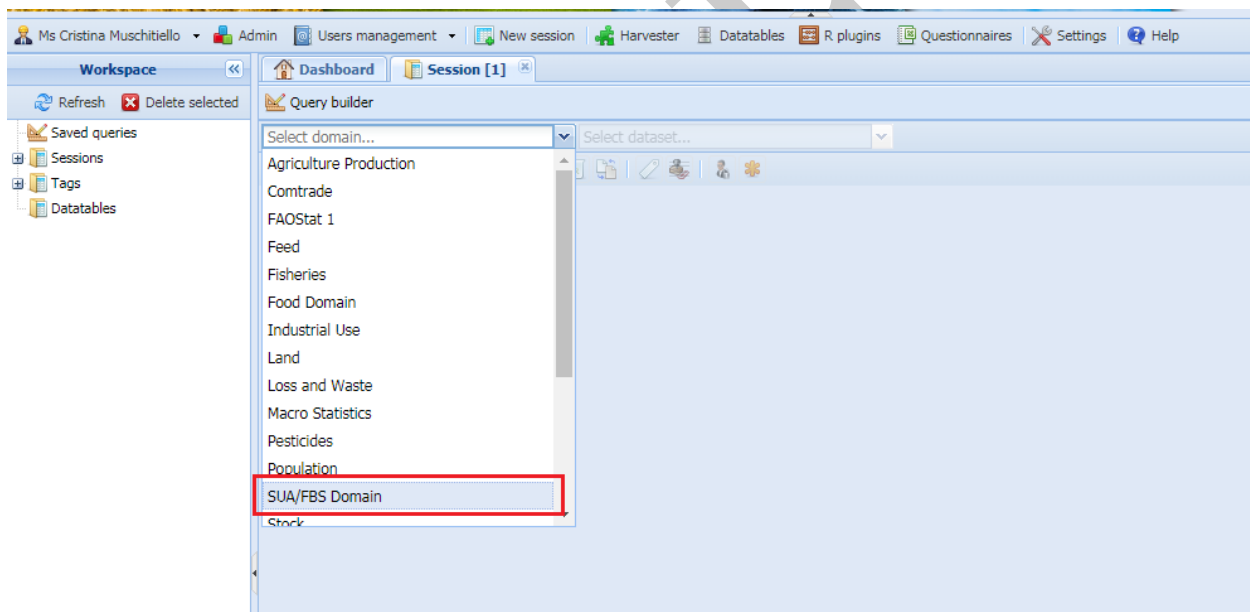

Figure 4: Select Domain

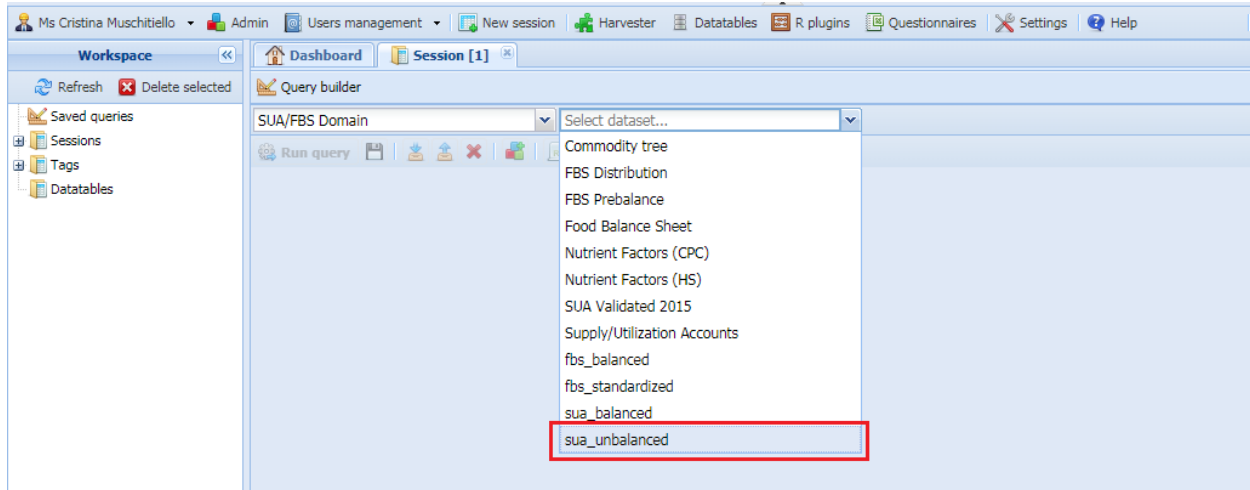

Figure 5: Select Dataset

3.1.1 Make and run the query on this session

The query has to be done only on the country for which the Pull data has to be performed. Indeed the plugin could be performed on one of the two following set of countries: *session Countries* or *all countries*. In our example *China, Mainland* is selected.

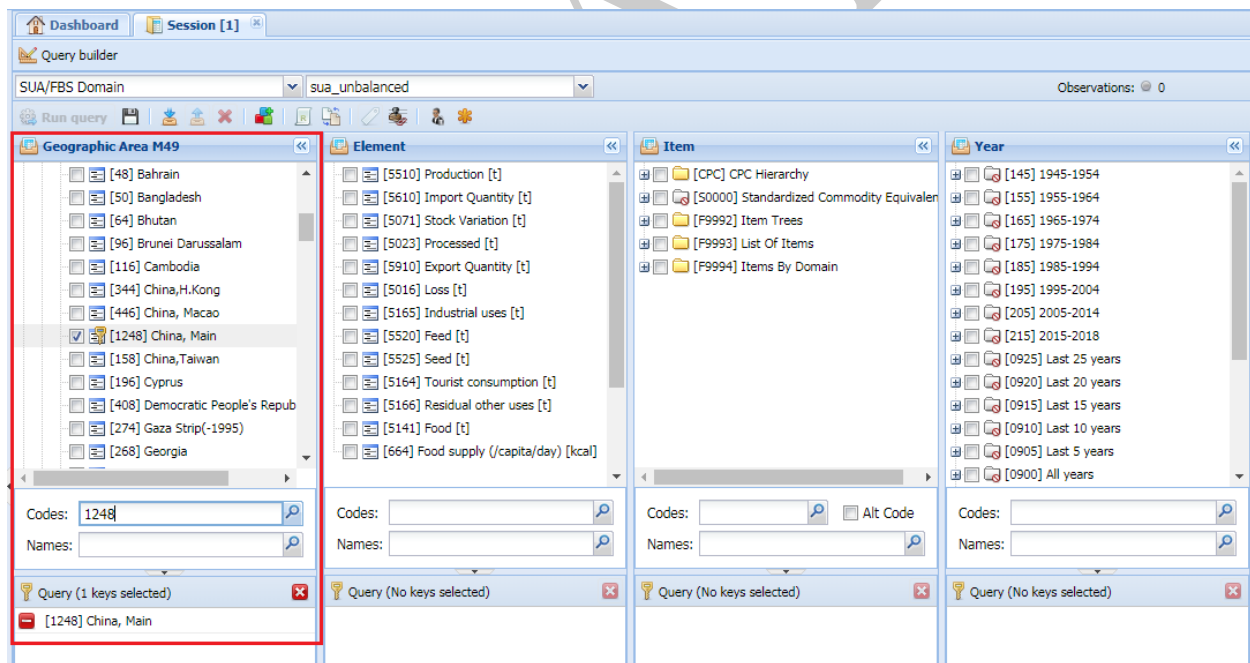

Figure 6: Select Country/ies

All elements here have to be selected (figure 7) and all items (figure 8). The years to be selected depend on the interest of the user. In this example the time range 2010:2016 is used

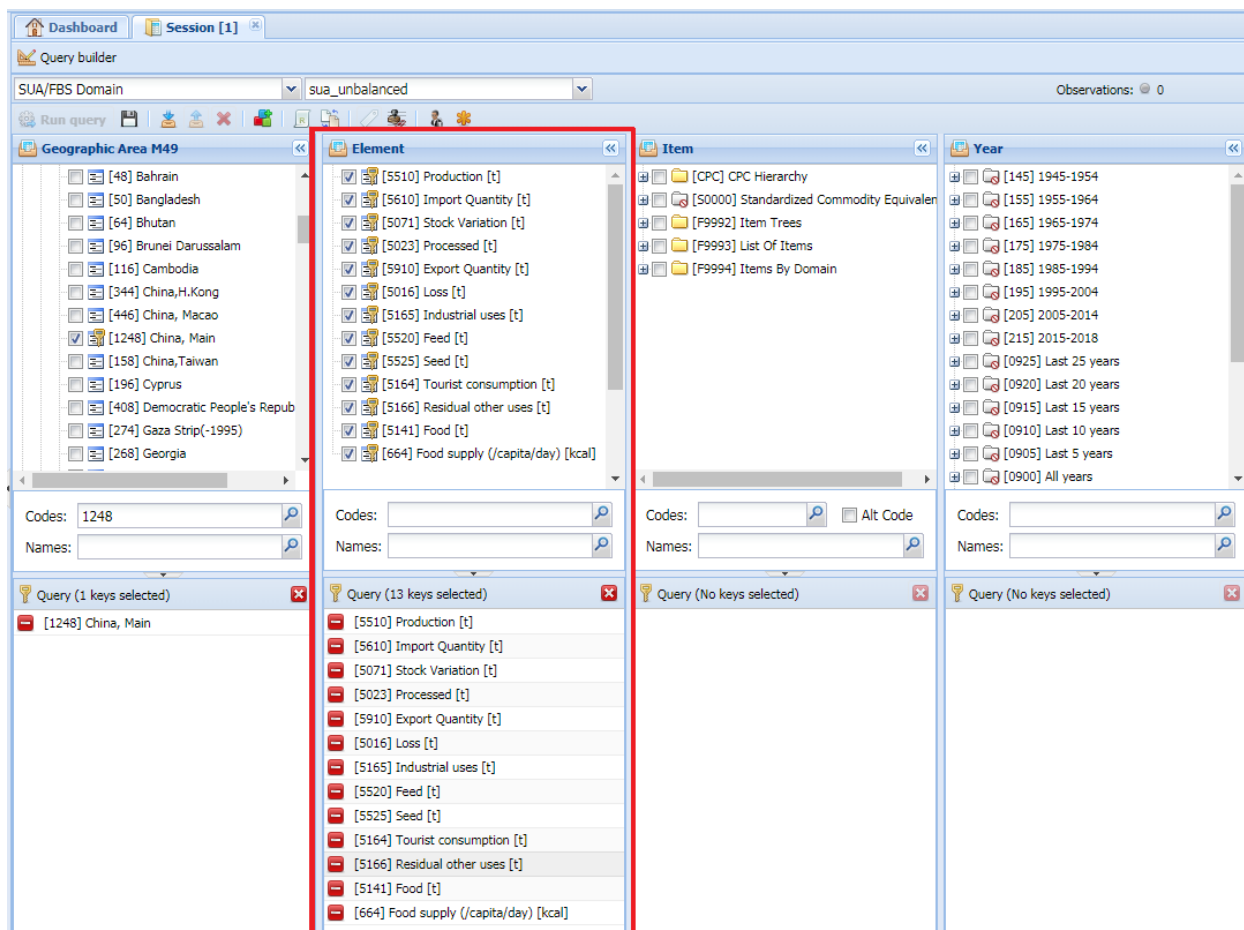

Figure 7: Select all Elements

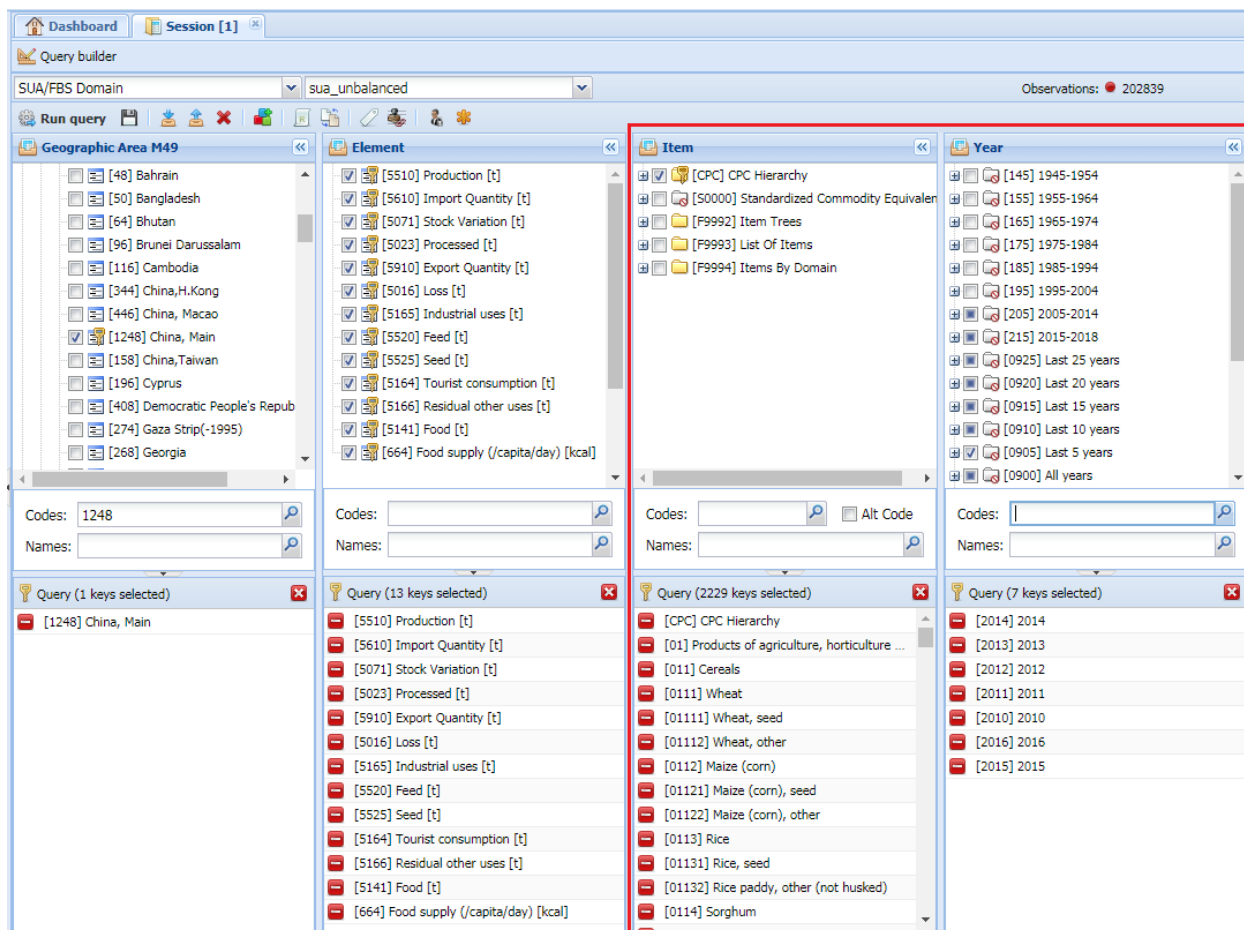

Figure 8: Select items and years

When all Variables have been defined, the query can be run:

Figure 9: Run query

3.1.2 The session content

The Session just created (figure 10) contains the data that will be input of the Plugin for that country. As said in the `pullDataToSua` plug-in document¹ “At the moment this dataset is filled with data coming from the old system (dataset “*suaValidated2015*”), from 2000 to 2013 for **all countries** and New data from 2014 onward”, if existing. If not existing, because the FBS have not been calculated yet, there will be blank cells to be filled.

¹*faoswsStandardization:pullDataToSUA plugin*

Figure 10: The Session

As previously mentioned, for the execution of the plugin and an easy managing of the operations, is better to rename the Session in a consistent and easily recognizable way.

3.1.3 Rename session

This session has the name that has been generated automatically from the SWS: *SUA 2018-06-05 12:25:52* representing the data-set, day and time of the creation of the Session. As reported in figures 11 to 13: 1. Right click on the session name 2. Select “Rename” 3. Assign a name 4. click “ok”

Geographic Area M49, Item	[2010] 2010	[2011] 2011	[2012] 2012	[2013] 2013	[2014] 2014	[2015] 2015
[1248] China, Main, [23511.02] Cane sugar, non-centrifugal						
[5510] Production [t]	432,000	436,000	440,000	440,000	387,084	348
[5520] Feed [t]						
[5141] Food [t]	432,000	436,000	440,000	440,000	387,084	348
[5164] Tourist consumption [t]					-99.76	
[664] Food supply (/capita/day) [kcal]	3.116	3.125	3.134	3.115		

Figure 11: Rename Session - 1

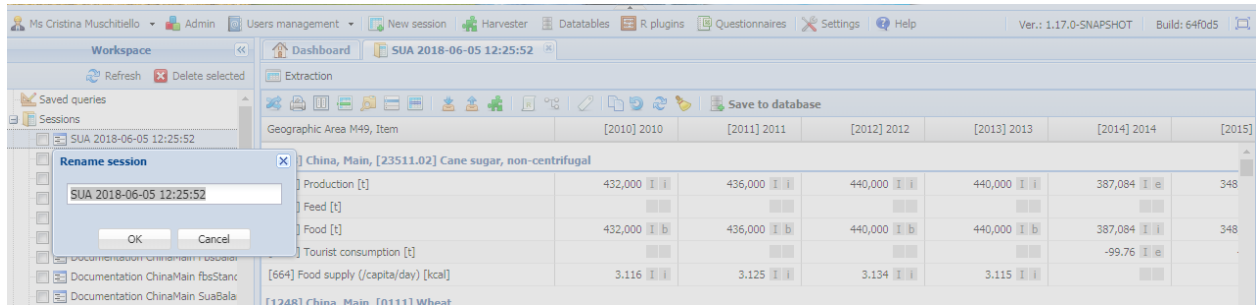

Figure 12: Rename Session - 2

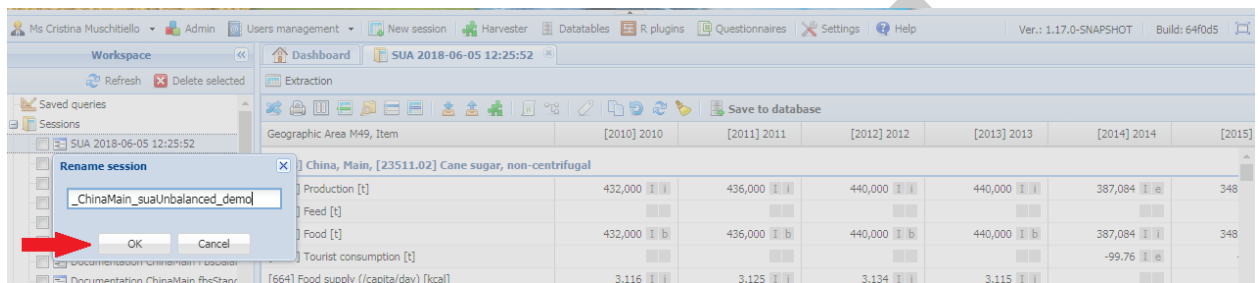

Figure 13: Rename Session - 3

3.2 sua-balanced session

A second session has to be opened on the domain: data-set *SUA/FBS:sua_balanced*.

3.2.1 Make and run the query on the session/Duplicate Session

This can be one in two ways. One can re-do all the steps for a new session, as reported in figures from 14 to 17 or *Duplicate* a session.

Figure 14: Sua balanced session - 1

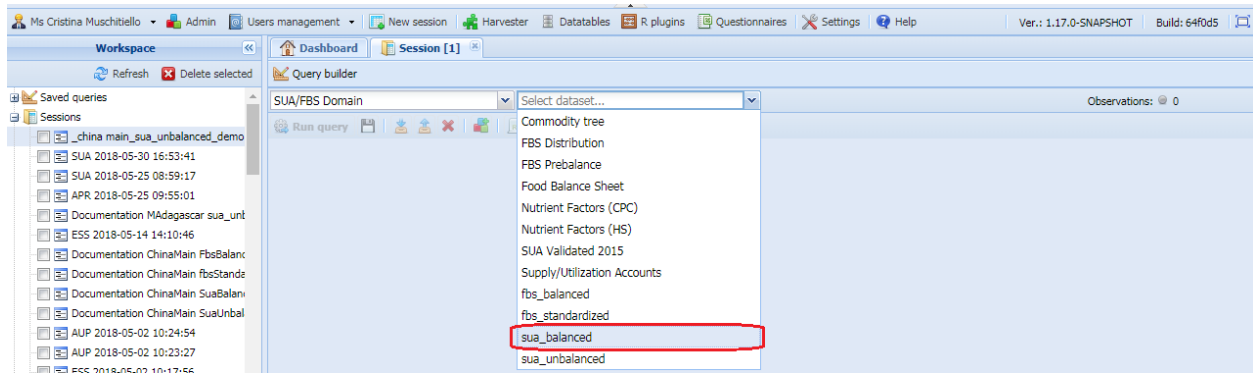

Figure 15: Sua balanced session - 2

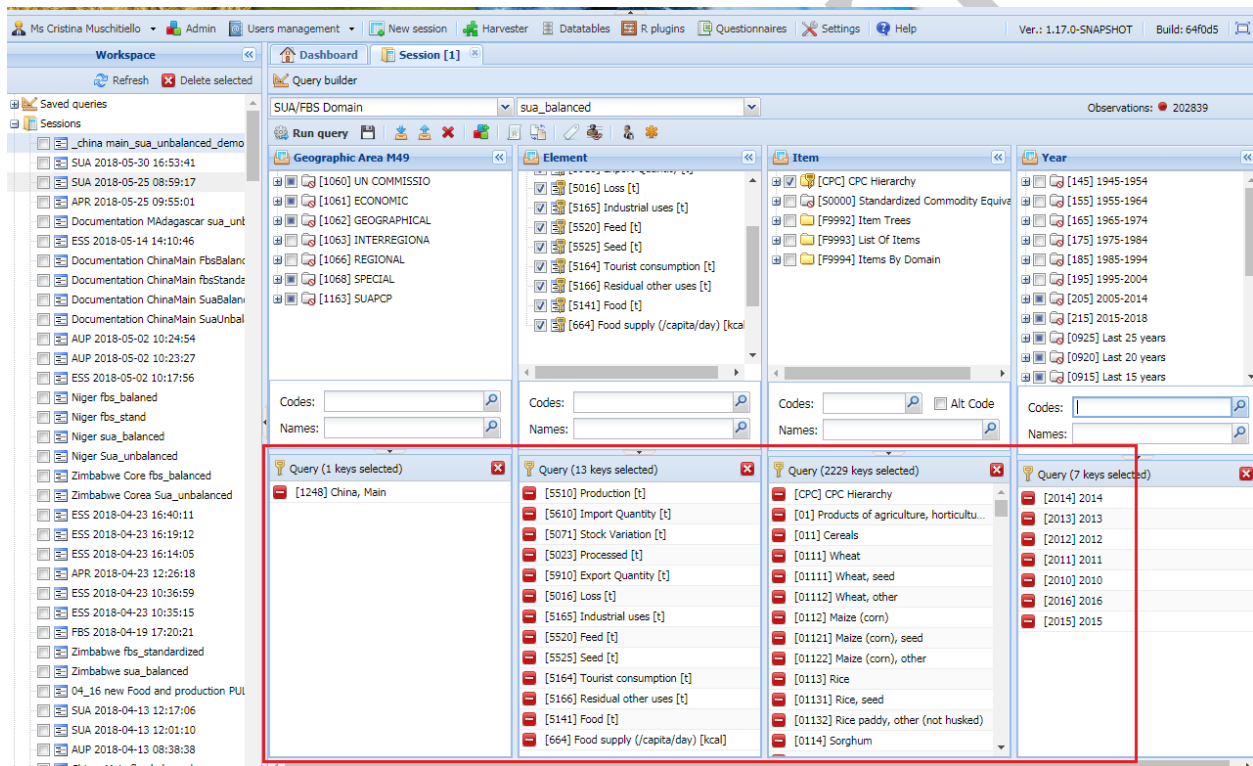

Figure 16: Sua balanced session - 3

Figure 17: Sua balanced session - 4

Instead of re-doing all these step, an alternative is that of ***duplicate*** a session. Indeed, any time one want to create a session on the same data-set of another or on a different data-set but same set of data, is possible

to select the *duplicate session* button (figure 18). The *Duplicate Session* option open a new window with a pre-set query identical to the one from which the session is duplicated. This new pre-set query is still open for changes, therefore, from here is possible to change the data-set and obtain the new session without having to select again all the variables. In our example one should do the *duplicate session* on the *sua_unbalanced* table and then change the data-set to *sua_balanced* (figure 19). This would allow for saving time in creating the new session on the second data-set, just selection the desired data-set and then running the query

Figure 18: Duplicate Session on sua unbalanced - 1

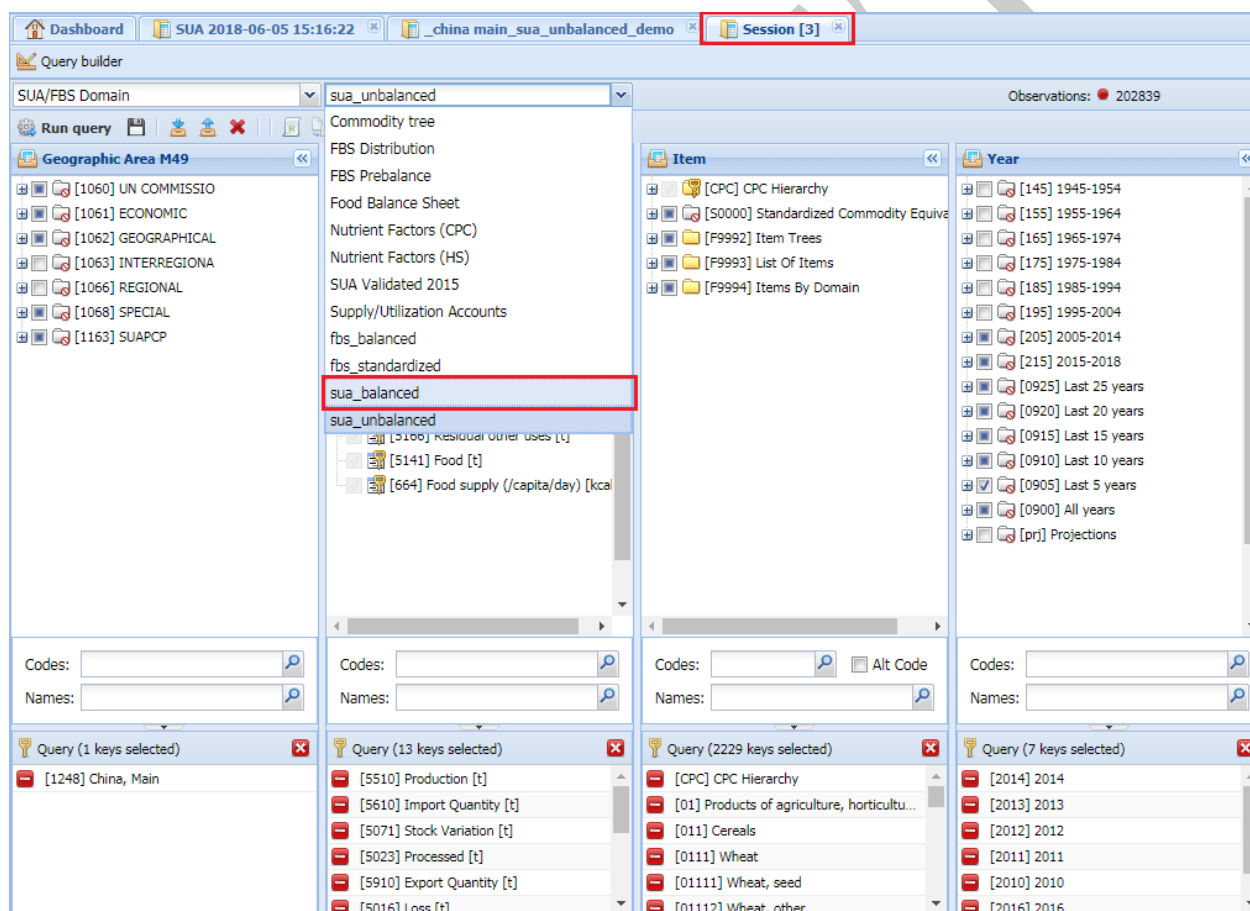

Figure 19: Duplicate Session on sua unbalanced - 2

3.2.2 Session content

Also *sua_balanced* data-set has been filled with data coming from the old system (dataset “*suaValidated2015*”), from 2000 to 2013 for **all countries** and New data from 2014 onward.

3.2.3 Rename session

Also this session has to be renamed (figure 20).

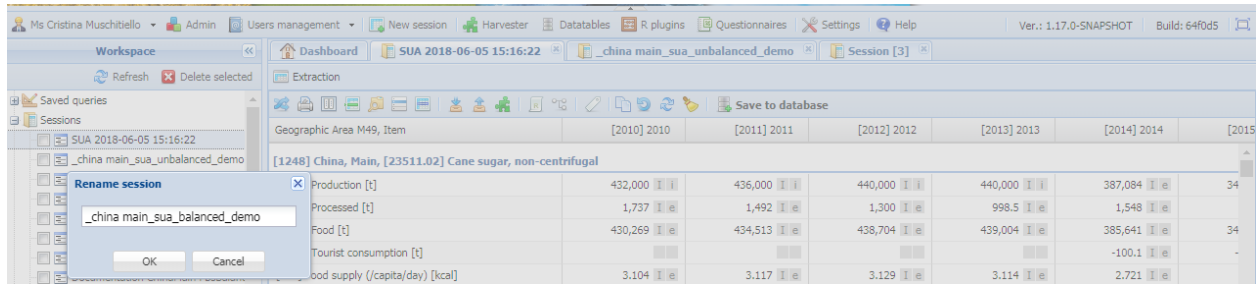

Figure 20: Rename session sua balanced

3.3 fbs-standardized session

This session is created using exactly the same steps just explained for the previous one. After the execution, the session has to be renamed.

3.3.1 Make and run the query on the session/Duplicate Session

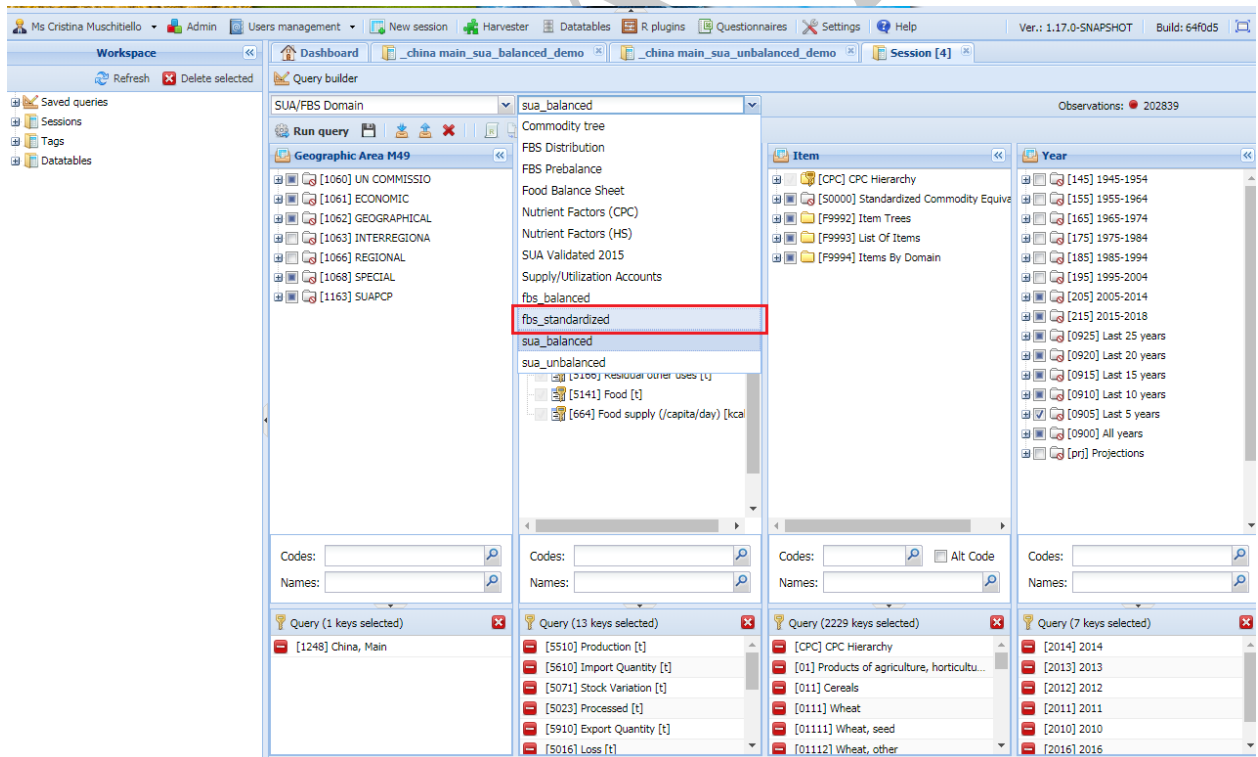

Figure 21: Duplicate balanced session in the fbs standardized dataset

3.3.2 Session content

Because the old system did not have this intermediate step and there was no old data stored to copy, this data-set has blank values up to 2013 and new data from 2014. The new data are available for countries that have been already processed for FBS.

3.3.3 Rename session

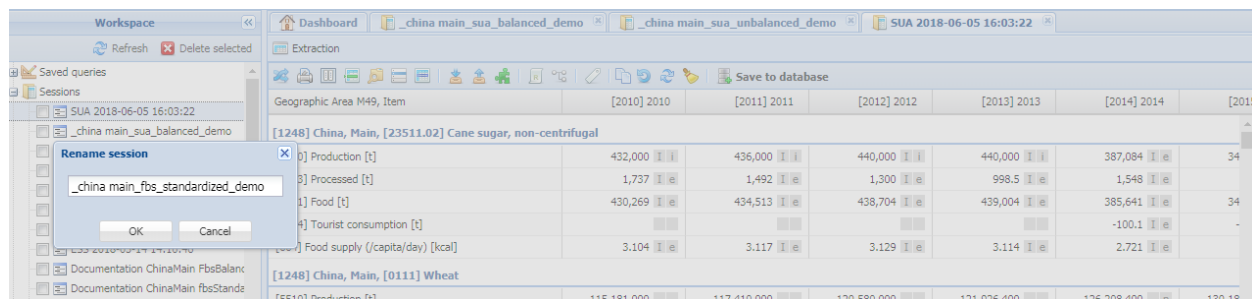

Figure 22: Rename session fbs standardized

3.4 fbs-balanced session

This is the main output data-set.

3.4.1 Make and run the query on the session/Duplicate Session

In the use of the *duplicate session* option all the FBS item have to be selected in addition to the CPC, because this data-set do not contain CPC item, therefore the session would come empty². Also nutritive factors have to be selected in this step (figure 23)

²this is just a visualization need, in the sense that even if the session is empty, it would be filled anyway after the plug-in will be run. Anyhow, the previous years would not be visualized if the FBS item are not selected

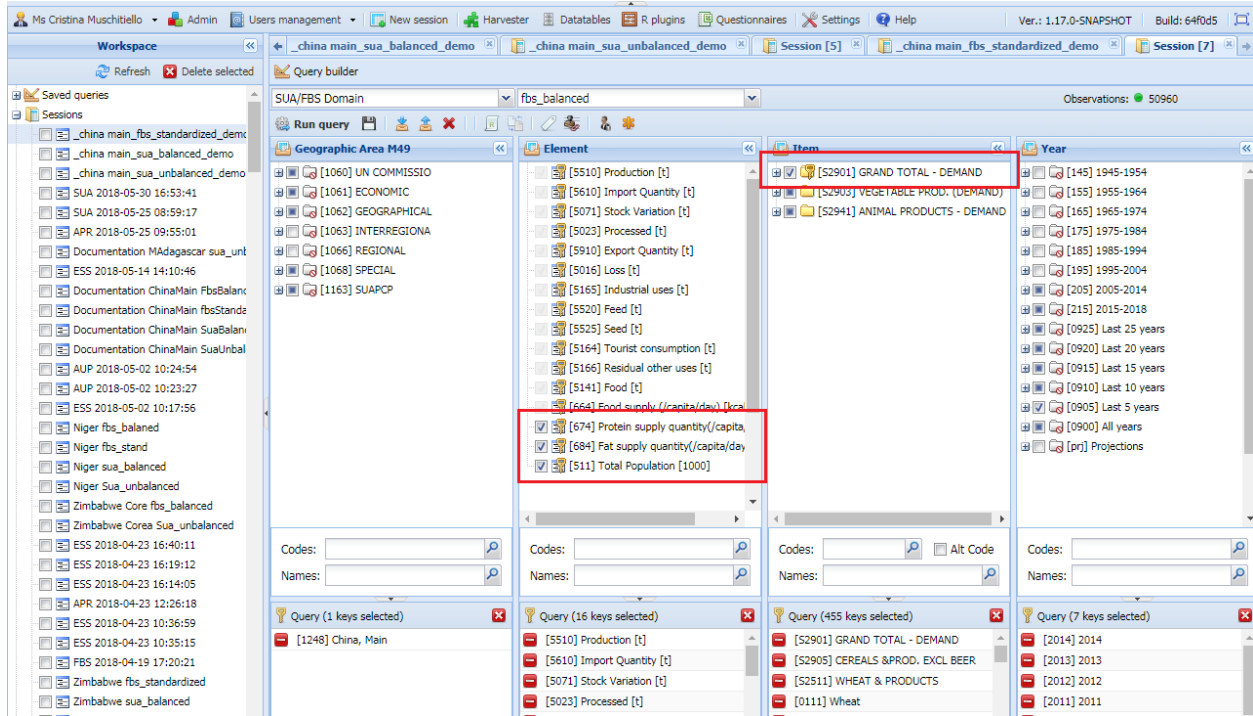

Figure 23: Duplicate fbs Standardized

3.4.2 Session content

FBS data coming from the old System are stored here from 2000 to 2013, while new FBS data are stored from 2014 onward. The new data are available for countries that have been already processed for FBS.

3.4.3 Rename session

Rename as the other data-sets.

Geographic Area M49, Item	[2010] 2010	[2011] 2011	[2012] 2012	[2013] 2013	[2014] 2014	[2015]

Figure 35: The session after the Run

6.2 fbs_standardized session

The screenshot displays the 'fbs_standardized' session in a software application. The interface includes a top navigation bar with tabs for 'Dashboard', '_china main_sua_balanced_demo', '_china main_sua_unbalanced_demo', '_china main_fbs_standardized_demo' (active), and '_china main_fba_balanced_demo'. Below the navigation bar is a toolbar with icons for extraction, saving to database, and other functions. The main data area is organized into a table with columns for years from 2010 to 2016. The data is grouped into three sections: 'Cane sugar, non-centrifugal', 'Wheat', and 'Maize (corn)'. Each section contains a list of items with their corresponding values for each year. The values are displayed in a color-coded format, with green indicating positive values and red indicating negative values. The bottom of the interface features a status bar with buttons for 'Data', 'Metadata', 'Block metadata', 'History', 'Live helper', and 'Validation'.
